EXPERIMENT

Title

ENCODE THE NUMBER

Description

You work in the message encoding department of a national security agency. Every message that is sent from or received in your office is encoded. You have an integer N, and each digit of N is squared and the squares are concatenated together to encode the original number. Your task is to find and return an integer value representing the encoded value of the number.

input1: An integer value N representing the number to be encoded.

00

Output:

Return an integer value representing the encoded value of the number.

Sample Input:

167

Sample Output:

13649

Source Code:

```
n=int(input())
res=0
f=1
 while n>0:
                                                 rem=n%10
                                              sq=rem**2
                                                if sq<10:
                                                                                              res=sq*f+res
                                                                                              f*=10
                                                else:
                                                                                              res+=sq*f
                                                                                              f*=100
                                              n//=10
print(res)
                                                                                                                                                                                                                     38R23ECO91 3RR23ECO91 3RC20ECO91 3RC20ECO91
